

June 2018

## Throttle Pot wiring Culven PT1 & Jenvey PT11 as used on TP & MT Kits

## IMPORTANT NOTE

In most cases the voltage for the throttle pot when the engine is at idle is 0.36 Volts, however this is only for engines that have been programmed by SBD. You will also need to know the units of air when the engine is at idle (this will be in KGs per hour) & the fuel pressure your engine was mapped. This will normally be in the ECU notes or refer to your engine builder or programmer.
